Checkpoint 10 Individual Progress \ w Andreea 15-04-2026

Daylyanov, Plamen P.R. 2 days ago

While doing my projects, I wrote a lot of documents, but I failed to utilize the DOT framework, which is a result of my not being able to understand how to take the applied research approach. To find a way to grasp how to use the DOT framework, I will prepare a couple of questions on which the research will be done, and get feedback on them.

My individual project currently lacks any functionality aside from users being able to log in and register. To fix that, I plan to add some simple guild and post functionality, as well as search.

To finish up everything, it will be documented and updated in my portfolio

Write a summary of what you discussed with your teacher...

Checkpoint 9 Thijs - Code, Layers, Repo, Individual, Group 13-04-2026

Daylyanov, Plamen P.R. 4 days ago

For my individual project, the design in focus now is the one I have worked on, the implementation of the connection with the database. The connection works by using Dapper as a micro-ORM, and the way its being done is by passing meta data with each table to make a correlation between it and the table it should match. Whereas in the group project, I am using EF, which makes the process a bit simpler and streamlined.
The code goes from Core, where entities reside, to the application, which contains the logic. The application layer calls the infrastructure layer, which establishes the database connectivity and the necessary CRUD actions. Everything in the end gets rendered in the MVC layer as a webpage

Checkpoint 8 Portfolio Review 1 30-03-2026

Daylyanov, Plamen P.R. 4 days ago

For the portfolio, be a bit more explicit about what is being included. Evidence should feature a brief description of what it includes, the content of the document should be properly structured, and ideally feature some sort of reflection.
Documents should be linked in the description of the project and summarize what they do and why they are being referenced.
Notes:
Why should we put everything in git? Why should everything be version-controlled? Even the database code? Do SOME Research about it, stay open to new approaches and how you do things, every code you develop should be version controlled, and it is important to know how to do so. If they can't see something in a quick way, then you are not done with it yet.

Checkpoint 7 Review Iteration 1 portfolio w/Andrius 19-03-2026

Daylyanov, Plamen P.R. a month ago

LO1 documents could use some adjustments, especially the test cases, which should be split into separate use cases and test cases. Future versions of the UML use cases should be redone. The URS should avoid repetition
Reflection documents can be added to each learning outcome to show how everything contributed to the creation of the project. Additionally, no document should be added without a purpose, and if necessary, additional reflection.
Should provide documents and evidence on the use of git (additionally, must use some git branching strategy) and architectural choice

Checkpoint 6 Andreea - Practice Portfolio Review 11-03-2026

Daylyanov, Plamen P.R. a month ago

URS documents should combine functional requirements and use cases together so they're easy to correlate. Use cases need to cover both the main success scenario and extensions, and test data should be provided to make those extensions meaningful. Acceptance testing is good to include but is primarily aimed at the user.
For the portfolio, you can upload one document per outcome and then specify multiple learning outcomes in the project plan. The collection description should briefly state who the client is, the project context and goals — essentially a short version of the project plan. In the description, link the full story of group progress including external resources like presentations, set the sprint goal, and clearly state who made what. If it was a group effort, explain individual contributions. Only include evidence that reflects your own contribution — don't add work you weren't part of.
A personal SWOT analysis is expected for both semester 1 and 2 as part of the professional standard. Later you'll need a document showing how you apply SOLID principles to previous or new evidence. Only include evidence that reflects your own contribution — don't add work you weren't part of.

Checkpoint 5 Thijs - Practise Portfolio Review 09-03-2026

Daylyanov, Plamen P.R. a month ago

Each project should have its own dedicated document, with links included in the description. Start with a solid project plan outlining scope and timelines, and iterate through phases: analysis, design, implementation, and review. Use cases form the basis for wireframes and must include preconditions, detailed steps, and MoSCoW prioritization. Functional requirements should be clear and limited to specific functions, while non-functional requirements need to be measurable and well-scoped. Include acceptance and unit testing guides, provide context for diagrams, and ensure GitHub links are accessible, showing branching strategies where relevant. Design documents should describe layered architecture, key components, feedback loops, and database design. Focus on quantity early, then refine, documenting each step thoroughly to maintain clarity and coherence throughout the project.

Checkpoint 4 Discuss IP (DB connection approach) w/A 05-03-2026

Daylyanov, Plamen P.R. a month ago

I implemented the Repository Pattern to abstract data access logic. To reduce duplication across repositories, I introduced a Generic Repository that handles common CRUD operations.

Because I am using Dapper, which does not provide built-in entity-to-table mapping like full ORMs, I created a custom attribute that specifies the database table associated with a given entity class.

The generic repository reads this attribute via reflection to determine the correct table name at runtime. This allows the repository logic to remain reusable while still supporting entity-specific table mappings.

Checkpoint 3 Thijs - Individual Idea 23-02-2026

Daylyanov, Plamen P.R. 2 months ago

After discussing the ideas and underlying concepts with my teacher and clarifying several important points, I took additional time to reflect on the direction I want to take with this project. I wanted to make sure the choice wasn't just practical, but also something I'm genuinely motivated to work on long-term. After thinking it through and having a follow-up discussion with Andrius, I decided to continue developing my community project rather than switching to a new concept. However, I plan to strengthen it by incorporating gamification elements to increase engagement, participation, and overall impact.

Checkpoint 2 Second discussion about new ideas w/A 13-02-2026

Daylyanov, Plamen P.R. 2 months ago

Initially, three project ideas were considered.
The first idea was a hotel booking application, but it was discarded because it offered limited opportunity to implement meaningful algorithms and would mostly involve basic data operations.
The second idea was an activity posting platform where users could post small tasks for others to complete. Although feasible, the concept lacked depth and did not feel engaging enough to pursue.
The third idea, which was ultimately selected, is a community hub application where users can join groups, share posts, and discuss topics. A key feature is a reputation system that works per community, influencing how users interact and how much impact their actions have.
This concept was chosen because it allows for more complex logic, stronger system design, and more interesting interaction mechanics compared to the other options.

Checkpoint 1 initial discussion w/A and w/R 09-02-2026

Daylyanov, Plamen P.R. 2 months ago

My initial idea was to develop a web-based application that allows players to view, edit, upload, and download Terraria player and world files.
The system would be composed of three main parts:
A web application responsible for the user interface, displaying decoded player and world data in a readable and editable format.
A backend API tasked with receiving files, decoding and encoding Terraria save formats, and exposing structured data to the frontend.
A Terraria mod acting as a bridge between the game and the backend, responsible for exporting and importing save files directly from the game environment.
The web application would use extracted metadata to correctly display in-game assets such as textures and item information.
After discussing the idea with my coaches, several shortcomings were identified. The project, as originally proposed, lacked a persistent database, meaning there was no data storage, state management, or opportunity to demonstrate CRUD operations. Additionally, object-oriented design was not clearly defined, and the overall system logic was considered too limited, as most of the functionality revolved around deterministic file parsing rather than higher-level application logic.
